Serpin F2 is also called alpha 2-antiplasmin (A2AP or plasmin inhibitor) is a serine protease inhibitor (serpin) responsible for inactivating plasmin and a member of serpin family. This protein is encoded by the SERPINF2 gene. Plasmin is an important enzyme that participates in fibrinolysis and degradation of various other proteins. Very few cases (<20) of A2AP deficiency have been described. As plasmin degrades blood clots, impaired inhibition of plasmin leads to a bleeding tendency, which was severe in the cases reported. In liver cirrhosis, there is decreased production of alpha 2-antiplasmin, leading to decreased inactivation of plasmin and an increase in fibrinolysis. This is associated with an increased risk of bleeding in liver disease.[1] Alpha 2-antiplasmin has been shown to interact with neutrophil elastase[2][3] and plasmin.[2][4]

PRINCIPLE OF THE ASSAY

This ELISA kit is for quantification of serpin F2/A2AP in dog. This is a shorter ELISA assay that reduces time to 50% compared to the conventional method, and the entire assay only takes 3 hours. This assay employs the quantitative sandwich enzyme immunoassay technique and uses biotin-streptavidin chemistry to improve the performance and the sensitivity of the assays. An antibody specific for porcine Serpin F2/A2AP has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any Serpin F2/A2AP present is bound by the immobilized antibody. After washing away any unbound substances, a detection antibody specific for porcine Serpin F2/A2AP is added to the wells. Following wash to remove any unbound antibody reagent, a detection reagent is added. After intensive wash a substrate solution is added to the wells and color develops in proportion to the amount of Serpin F2/A2AP bound in the initial step. The color development is stopped and the intensity of the color is measured.

This package insert must be read in its entirety before using this product.

Storage
Store at 4°C. The kit can be used in 3 months.

Bring all reagents to room temperature before use.

Reagent Preparations

**Human Serpin F2/A2AP Detection Antibody** (1 vial) – The lyophilized Detection Antibody should be stored at 4°C for up to 3 months, if not used immediately. Centrifuge for 1 min at 6000 x g to bring down the material prior to open the vial. The vial contains sufficient Detection Antibody for a 96-well plate. Add 200 µL of sterile 1 x PBS and vortex 30 sec. If the entire 96-well plate is used, take 200 µL of detection antibody to 10.5 mL of Reagent Diluent to make **Working dilution of detection antibody** and mix thoroughly prior to the assay. If the partial antibody is used store the rest at -20°C until use.

**Human Serpin F2/A2AP Standard** (3 vials) – The lyophilized Human Serpin F2/A2AP Standard has a total of 3 vials. Each vial contains the standard sufficient for generating a standard curve. The unreconstituted standard can be stored at 4°C for up to 3 months if not used immediately. Centrifuge for 1 min at 6000 x g to bring down the material prior to open the tube. Add 500 µL of 1 x Assay Buffer to make the high standard concentration of 6000 pg/ml and vortex for 30 sec. A seven-point standard curve is generated using 2-fold serial dilutions in the Assay Buffer, vortex 30 sec for each of dilution step.

**Conjugate** (53 µl) – Centrifuge for 1 min at 6000 x g to bring down the material prior to open the vial. The vial contains 53 µL Conjugate sufficient for one 96-well plate. If the volume is less than 53 µL, add sterile 1 x PBS to reach 53 µL and vortex 10 sec. Make 1:200 dilutions in Reagent Diluent. If the entire 96-well plate is used, add 53 µL of Conjugate to 10.5 mL of Reagent Diluent to make **working dilution of Conjugate** and mix thoroughly prior to the assay. The rest of undiluted Conjugate can be stored at 4°C for up to 3 months. DO NOT FREEZE.

**20 x PBS**, pH 7.3, 30 mL- Dilute to 1 x PBS with deionized distilled water and mix well prior to use.
**20 x Assay Buffer**, 20 mL- Dilute to 1 x Assay Buffer with 1 x PBS prior to use.
**Reagent Diluent**, 21 mL.
**Substrate Solution**, 10.5 mL.
**Stop Solution**, 5.5 mL.

**Assay Procedure**

1. Lift the plate cover from the top left and cover the wells that are not used. Vortex briefly the samples prior to the assay. Add 100 µL of sample (such as plasma or serum) or standard per well and use duplicate wells for each standard or sample. Cover the 96-well plate and incubate 1 hour at room temperature.

2. Aspirate each well and wash with 1 x Assay Buffer, repeating the process two times for a total of three washes. Wash by filling each well with 1 x Assay Buffer (300 µL) using a multi-channel pipette, manifold dispenser or auto-washer. Complete removal of liquid at each step is essential for good performance. After the last wash, remove any remaining Assay Buffer by aspirating or by inverting the plate and blotting it against clean paper towels.

3. Add 100 µL of the working dilution of the Detection Antibody to each well. Cover the plate and incubate 1 hour at room temperature.

4. Repeat the aspiration/wash as in step 2.

5. Add 100 µL of the working dilution of Conjugate to each well. Cover the plate and incubate for 20 minutes at room temperature. Avoid placing the plate in direct light.

6. Repeat the aspiration/wash as in step 2.

7. Add 100 µL of Substrate Solution to each well. Incubate for 10-20 minutes at room temperature. Avoid placing the plate in direct light.

8. Add 50 µL of Stop Solution to each well. Gently tap the plate to ensure thorough mixing.

9. Determine the optical density of each well immediately, using a microplate reader set to 450 nm. If wavelength correction is available, set to 540 nm or 570 nm. If wavelength correction is not available, subtract readings at 540 nm or 570 nm from the readings at 450 nm. This subtraction will correct for optical imperfections in the plate. Readings made directly at 450 nm without correction may be higher and less accurate.

**Precaution and Technical Notes**

1. It is critical to follow the procedure step by step otherwise appropriate color development may not occur as expected.

2. A standard curve should be generated for each set of samples assayed. Thorough mixing of standards at each of dilution steps is critical to acquire a normal standard curve.

3. Plasma or serum sample should be diluted with equal volume of 1 x Assay Buffer and vortex for 1 min prior to assay. If the OD value still exceeds the upper limit of the standard curve, further dilution is recommended till it falls in the detection range and the dilution factor must be used for calculation of the concentration.

4. Conjugate contains enzyme, DO NOT mass up with Detection Antibody.

5. The Stop Solution is an acid solution, handle with caution.

6. This kit should not be used beyond the expiration date on the label.

7. A thorough and consistent wash technique is essential for proper assay performance.

8. Use a fresh reagent reservoir and pipette tips for each step.

9. It is recommended that all standards and samples be assayed in duplicate.

10. Avoid microbial contamination of reagents and buffers. This may interfere with the sensitivity of the assay.
Calculation of Results

Average the duplicate readings for each standard, control, and sample and subtract the average zero (blank) standard optical density.

Create a standard curve by reducing the data using computer software capable of generating a four-parameter logistic (4-PL) curve-fit. As an alternative, construct a standard curve by plotting the mean absorbance for each standard on the y-axis against the concentration on the x-axis and draw a best fit curve through the points on the graph. The data may be linearized by plotting the log of the Serpin F2/A2AP concentrations versus the log of the O.D. and the best fit line can be determined by regression analysis. This procedure will produce an adequate but less precise fit of the data. If samples have been diluted, the concentration read from the standard curve must be multiplied by the dilution factor.

The Standard Curve

The graph below represents typical data generated when using this Human Serpin F2/A2AP ELISA Kit. The standard curve was calculated using a computer generated 4-PL curve-fit. For this case, a Bio-Rad iMark™ Microplate Reader and a Microplate Manager 6 Software were used to generate this curve. The correlation coefficient ($r^2$) is 0.999-1.000.
Nori® Human Serpin F2/A2AP ELISA Kit DataSheet

Specificity
The following recombinant human proteins prepared at 10 ng/ml were tested and exhibited no cross-reactivity or interference.
ApoA1, BMP1, BMP2, BMP3, BMP4, CRP, HGF, HSP27, IL-1β, IL-1RA, IL-2, IL-5, IL-6, IL-8, IL-10, IL-12, IL-13, IL-15, IL-17C, IL-21, IFNγ, MMP-2, MMP-9, sIL-2R, sIL-6R, PDGF, PLA2G7, TGFβ1, TGFβ2, TGFβ3, TLR1, TLR2, TLR3, TNF-α, TNF RI, TNF RII, VEGF.

Calibration
This kit is calibrated against a highly-purified CHO cell-expressed recombinant human Serpin F2/A2AP.

Detection Range
62-4000 pg/ml

Assay Sensitivity
12 pg/ml

Assay Precision
Intra-Assay %CV: 6; Inter-Assay %CV: 9
