

## Nori® Chicken CXCL4 (PF4) ELISA Kit-DataSheet

Platelet factor 4 (PF4) is a small cytokine belonging to the CXC chemokine family that is also known as chemokine (C-X-C motif) ligand 4 (CXCL4) and is encoded by PF4 gene.[1] This chemokine is released from alpha-granules of activated platelets during platelet aggregation, and promotes blood coagulation by moderating the effects of heparin-like molecules. It is usually found in a complex with proteoglycan. Platelet factor-4 is a 70-amino acid protein that is released from the alpha-granules of activated platelets and binds with high affinity to heparin. Its major physiologic role appears to be neutralization of heparin-like molecules on the endothelial surface of blood vessels, thereby inhibiting local antithrombin activity and promoting coagulation. As a strong chemoattractant for neutrophils, monocytes and fibroblasts, PF4 probably has a role in inflammation and wound repair.[2] PF4 interacts with a splice variant of the chemokine receptor CXCR3, known as CXCR3B.[3] The heparin:PF4 complex is the antigen in heparin-induced thrombocytopenia, an idiosyncratic autoimmune reaction to the administration of the anticoagulant heparin.[4] PF4 autoantibodies have also been found in patients with thrombosis and features resembling HIT but no prior administration of heparin.[5] It is increased in patients with systemic sclerosis that also have interstitial lung disease.[6] The Chicken PF4 kills malaria parasites within erythrocytes by selectively lysing the parasite's digestive vacuole.[7] Study elucidate an unanticipated mechanism for CXCL4-mediated immune amplification in systemic sclerosis, in which CXCL4 organizes 'self' and microbial DNA into liquid crystalline immune complexes that amplify TLR9-mediated plasmacytoid dendritic cell hyperactivation and interferon-alpha production. Surprisingly, this activity does not require CXCR3, the CXCL4 receptor.[8] Non-platelet-derived CXCL4 differentially regulates cytotoxic and regulatory T cells through CXCR3 to suppress the immune response to colon cancer.[9] Observations suggest the crucial role of platelet cytokine PF4 as the rapid enhancer of replication as well as propagation of both observations together suggest the crucial role of platelet cytokine PF4 as the rapid enhancer of replication as well as propagation of both Dengue virus and Japanese Encephalitis virus in host cells including monocytes by inhibiting IFN response of these immune cells.[10]

### PRINCIPLE OF THE ASSAY

This ELISA kit is for quantification of CXCL4 (PF4) in Chicken samples. This is a shorter ELISA assay that reduces time to 50% compared to the conventional method, and the entire assay only takes 3 hours. This assay employs the quantitative sandwich enzyme immunoassay technique and uses biotin-streptavidin chemistry to improve the performance and the sensitivity of the assays. An antibody specific for Chicken CXCL4 (PF4) has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any CXCL4 (PF4) present is bound by the immobilized antibody. After washing away any unbound substances, a detection antibody specific for Chicken CXCL4 (PF4) is added to the wells. Following wash to remove any unbound antibody reagent, a detection reagent is added. After intensive wash a substrate solution is added to the wells and color develops in proportion to the amount of CXCL4 (PF4) bound in the initial step. The color development is stopped, and the intensity of the color is measured.

This package insert must be read in its entirety before using this product.

**Storage** Store the kit at 4°C. The kit can be used in 6 months.

## Nori® Chicken CXCL4 (PF4) ELISA Kit-DataSheet

### MATERIALS PROVIDED

Description	Quantity	Description	Quantity	Description	Quantity
Antibody Precoated Plate	1	20 x PBS	1	Substrate Solution	1
Detection Antibody	1	20 x Assay Buffer	1	Stop Solution	1
HRP Conjugate	1	Reagent Diluent	1	DataSheet	1
Standard	3	MSDS/CoA	1	96-well plate sheet	1

Bring all reagents to room temperature before use.

### Reagent Preparations

**Chicken CXCL4 (PF4) Detection Antibody** (1 vial) – The lyophilized Detection Antibody should be stored at 4°C for up to 6 months, if not used immediately. Centrifuge for 1 min at 6000 x g to bring down the material prior to open the vial. The vial contains sufficient Detection Antibody for a 96-well plate. Add 200 µL of sterile 1 x PBS and vortex 30 sec. If the entire 96-well plate is used, take 200 µL of detection antibody to 10.5 mL of Reagent Diluent to make **Working dilution of detection antibody** and vortex 30 sec prior to the assay. If the partial antibody is used store the rest at -20°C until use.

**Chicken CXCL4 (PF4) Standard** (3 vials) – The lyophilized Chicken CXCL4 (PF4) Standard has a total of 3 vials. Each vial contains the standard sufficient for generating a standard curve. The unreconstituted standard can be stored at 4°C for up to 6 months if not used immediately. Centrifuge for 1 min at 6000 x g to bring down the material prior to open the tube. Add 500 µL of 1 x Assay Buffer to make the high standard concentration of 1 ng/ml and **vortex for 1 min**. A seven-point standard curve is generated using 2-fold serial dilutions in the Assay Buffer, **vortex 30 sec** for each of dilution step.

**HRP Conjugate** (53 µl) – Centrifuge for 1 min at 6000 x g to bring down the material prior to open the vial. The vial contains 53 µL HRP Conjugate sufficient for one 96-well plate. If the volume is less than 53 µL, add sterile 1 x PBS to reach 53 µL and vortex 10 sec. Make 1:200 dilutions in Reagent Diluent. If the entire 96-well plate is used, add 53 µL of HRP Conjugate to 10.5 mL of Reagent Diluent to make **working dilution of HRP Conjugate** and vortex 30 sec prior to the assay. The rest of undiluted HRP Conjugate can be stored at 4°C for up to 6 months. **DO NOT FREEZE.**

**20 x PBS, pH 7.3, 30 mL**- Dilute to 1 x PBS with deionized distilled water and mix well prior to use.

**20 x Assay Buffer, 20 mL**- Dilute to 1 x Assay Buffer with 1 x PBS prior to use.

**Reagent Diluent, 21 mL.**

**Substrate Solution, 10.5 mL.**

**Stop Solution, 5.5 mL.**

**Sample types:** Plasma, serum, cell/tissue lysates, cell culture supernatant, synovial fluid (SF), bronchoalveolar lavage (BAF), cerebrospinal fluid (CSF), urine, other biological fluid.

## Nori® Chicken CXCL4 (PF4) ELISA Kit-DataSheet

### Assay Procedure

1. Lift the plate cover from the top left and cover the wells that are not used. **Vortex the standards and samples for 10 sec** prior to the assay. Add 100 µL of **diluted sample** (see below) or **standard** per well and use duplicate wells for each standard or sample. Cover the 96-well plate and incubate 1 hour at room temperature. Attention: **MUST vortex standards and samples for 10 sec before pipetting to the wells!**
2. Aspirate each well and wash with **1 x Assay Buffer**, repeating the process one time for a total of two washes. Wash by filling each well with 1 x Assay Buffer (300 µL) using a multi-channel pipette, manifold dispenser or auto-washer. Complete removal of liquid at each step is essential for good performance. After the last wash, remove any remaining Assay Buffer by aspirating or by inverting the plate and blotting it against clean paper towels.
3. Add 100 µL of the **working dilution of Detection Antibody** to each well. Cover the plate and incubate 1 hour at room temperature.
4. Repeat the aspiration/wash as in step 2.
5. Add 100 µL of the **working dilution of HRP Conjugate** to each well. Cover the plate and incubate for 20 minutes at room temperature. Avoid placing the plate in direct light.
6. Repeat the aspiration/wash as in step 2.
7. Add 100 µL of **Substrate Solution** to each well. Incubate for up to 20 minutes (**depending on signal**) at room temperature. Over incubation of the substrate will result in over flow of high standard and thus should be avoided. Avoid placing the plate in direct light.
8. Add 50 µL of **Stop Solution** to each well. Gently tap the plate to ensure thorough mixing.
9. Determine the optical density of each well immediately, using a microplate reader set to 450 nm. If wavelength correction is available, set to 540 nm or 570 nm. If wavelength correction is not available, subtract readings at 540 nm or 570 nm from the readings at 450 nm. This subtraction will correct for optical imperfections in the plate. Readings made directly at 450 nm without correction may be higher and less accurate.

**Sample dilution:** Samples should be diluted with four volumes of 1 x Assay Buffer and vortex for 1 min prior to assay. If the OD value still exceeds the upper limit of the standard curve, further dilution is recommended till it falls in the detection range and the dilution factor must be used for calculation of the concentration.

### **Precaution and Technical Notes**

1. It is critical to follow the procedure step by step otherwise appropriate color development may not occur as expected.
2. A standard curve should be generated for each set of samples assayed. Thorough mixing of standards at each of dilution steps is critical to acquire a normal standard curve and **vortex again (10 sec) before pipetting to the 96-well plate.**
3. HRP Conjugate contains enzyme, DO NOT mass up with Detection Antibody.
4. The Stop Solution is an acid solution, handle with caution.
5. This kit should not be used beyond the expiration date on the label.
6. A thorough and consistent wash technique is essential for proper assay performance.
7. Use a fresh reagent reservoir and pipette tips for each step.
8. It is recommended that all standards and samples be assayed in duplicate.
9. Avoid microbial contamination of reagents and buffers. This may interfere with the sensitivity of the assay.

## Nori® Chicken CXCL4 (PF4) ELISA Kit-DataSheet

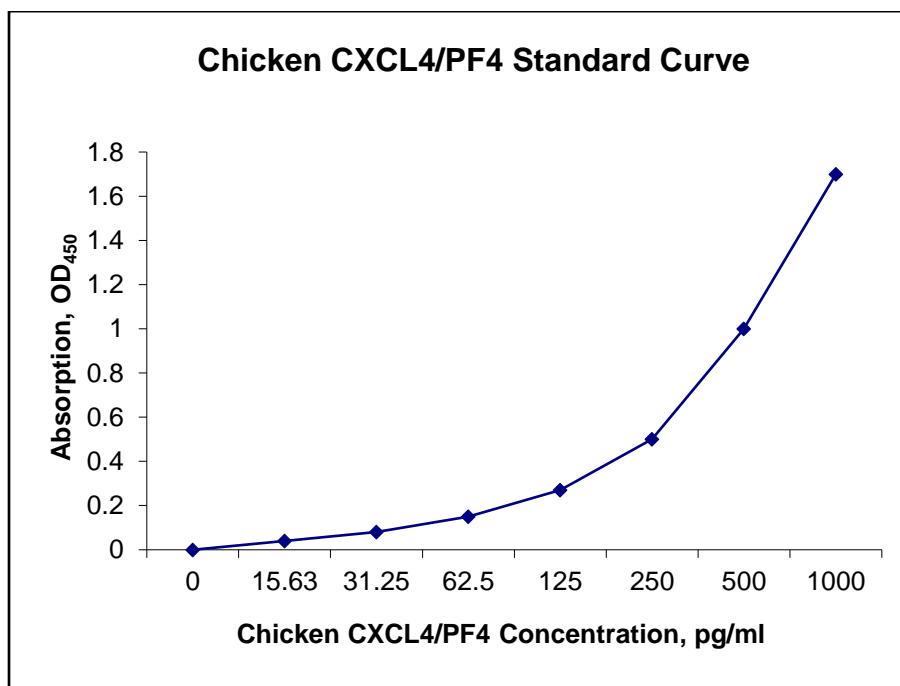

### Calculation of Results

Average the duplicate readings for each standard, control, and sample and subtract the average zero (blank) standard optical density.

Create a standard curve by reducing the data using computer software capable of generating a four-parameter logistic (4-PL) curve-fit. As an alternative, construct a standard curve by plotting the mean absorbance for each standard on the y-axis against the concentration on the x-axis and draw a best fit curve through the points on the graph. The data may be linearized by plotting the log of the CXCL4 (PF4) concentrations versus the log of the O.D. and the best fit line can be determined by regression analysis. This procedure will produce an adequate but less precise fit of the data. If samples have been diluted, the concentration read from the standard curve must be multiplied by the dilution factor.

### The Standard Curve

The graph below represents typical data generated when using this Chicken CXCL4 (PF4) ELISA Kit. The standard curve was calculated using a computer generated 4-PL curve-fit. For this case, a Bio-Rad iMark™ Microplate Reader and a Microplate Manager 6 Software were used to generate this curve. The correlation coefficient ( $r^2$ ) is 0.999-1.000.

## Nori® Chicken CXCL4 (PF4) ELISA Kit-DataSheet

### Specificity

The following recombinant Chicken proteins prepared at 10 ng/ml were tested and exhibited no cross-reactivity or interference.

ApoAI, BMP1, BMP2, BMP3, BMP4, BMP7, CRP, CXCL1, HGF, HSP27, IL-1 $\alpha$ , IL-1 RI, IL-1 $\beta$ , IL-1RA, IL-2, IL-4, IL-5, IL-6, IL-8, IL-10, IL-12, IL-13, IL-15, IL-17C, IL-21, IL-23, IFN $\gamma$ , MMP-2, sIL-2R, sIL-6R, PDGF, PLA2G7, prolactin, TGF $\beta$ 1, TGF $\beta$ 2, TGF $\beta$ 3, TLR1, TLR2, TLR3, TNF- $\alpha$ , TNF RI, TNF RII, VEGF.

### Calibration

This kit is calibrated against a highly purified CHO cell-expressed recombinant Chicken CXCL4 (PF4).

### Detection Range

15.6-1,000 pg/ml

### Assay Sensitivity

3 pg/ml

### Assay Precision

Intra-Assay %CV: 6; Inter-Assay %CV: 9

**Sample types:** Plasma, serum, cell/tissue lysates, cell culture supernatant, synovial fluid (SF), bronchoalveolar lavage (BAF), cerebrospinal fluid (CSF), urine, other biological fluid.
